16.00									16

The 120-day-old average medial $Mdn = 20.5$ (mm) expansion with respect to the tubercle was larger than lateral $Mdn = 4.0$ (mm) expansion. A Wilcoxon signed-rank test indicated this difference (16.50 mm) was statistically significant, 95% CI [16.0, 17.0], $\alpha = 0.05$, $r = 0.66$, with a large effect size $r = 0.66$.

Calculate the 95% CI

The average lateral expansion with respect to the tubercle increased from 120-days-old (dn = 4.0 mm) to 900-days-old (dm = 15.0 mm). A Mann-Whitney test indicated this difference (11.0 mm) was statistically significant, 95% CI [1.0, 15.0], U₆ = 6, N₍₂₀₎ = 8, z = 3.23, P = .001, with a large effect size (r = .86).
